Corporate Management System

Corporate management is used for know the employees detail is a concern. It will very easy to know the employee status in data base system. Data base can create an employee ID for a employees and they can update their daily profile. The admin can view the status of the employees for any particular for any day time.

The PHP is used for developing this project . The advantage of platform independence of PHP is taking to support by many languages. We can develop the web application using PHP. To develop this project in all type of operating system. we have used the portability advantage here that is we can run same coding any type of web server in web application server as well.

The Corporate management driver is used in this program to connect the data base system. We have used the SQL server database here. So we are using the SQL analyzer to connect the SQL server data base from the PHP. The SQL server is free date base. So we can achieve the system with minimum of cost. We have developed the office management system in extra coding.

Front – End : PHP

Back – End : My SQL

The project “Corporate management” consists of several modules. Each module performs some kind of operations.

The modules are:

- attendance
- employee movement
- leave management
- letters and file management
- pay roll management
- visitors management
